Neck Pain ICF Impairment-based Classification:

Neck pain with
mobility deficits

Neck pain with
headaches

Neck pain with
radiating pain

Neck pain with
movement coordination
impairments

J Orthop Sports Phys Ther. 2008;38 (September): A1-A39

Neck pain with mobility deficits

- ICD Diagnosis
 - Cervicalgia
 - Pain in thoracic spine

- Isolated neck pain
- Restricted cervical range of motion
- Pain provocation and mobility deficits with palpation of cervical/thoracic joints

Limited rotation!

Neck pain with mobility deficits

Interventions

- Cervical mobilization/manipulation
- Thoracic mobilization/manipulation
- Stretching exercises
- Coordination, strengthening, and endurance exercises

Neck pain with headache

- ICD Diagnoses:
 - Headaches
 - Cervicocranial syndrome

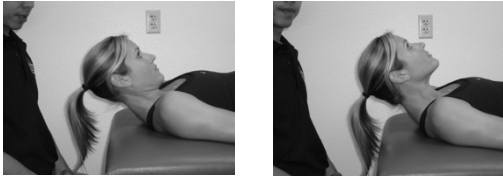

Key findings

- Headache reproduced with provocation of the involved upper cervical segments
- Restricted upper cervical segmental mobility

Key findings

- Abnormal/substandard performance on the cranial cervical flexion test

Restrict cervical range of motion

Key findings

1. Patient is supine.
2. Examiner is at head of patient.
3. Resting symptoms are assessed.
4. Patient actively flexes neck to maximum range.
5. Examiner applies full rotational force to both sides.
6. Symptoms are reassessed during each motion.
7. (+) test with pain provocation and/or
8. (+) test if loss of 10° or greater.

Limited rotation!

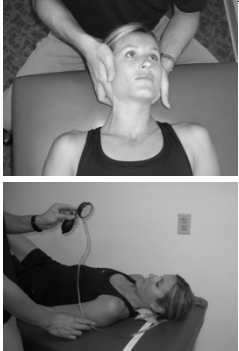

FIGURE 6-16 Flexion-Rotation Test

| Reliability | Sensitivity | Specificity | (+) LR | (-) LR |
|-------------|-------------|-------------|--------|--------|
| NT | 88 | 100 | NA | NA |

Neck pain with headache

Interventions

- Cervical mobilization/manipulation
- Stretching exercises
- Coordination, strengthening, and endurance exercises

Neck pain with radiating pain

- ICD Diagnoses:
 - Spondylosis with radiculopathy
 - Cervical disc disorder with radiculopathy

Neck pain with movement coordination impairments

- ICD diagnosis:
 - Sprain and strain of cervical spine

Neck pain with movement coordination impairments

Moderate evidence

Key Findings

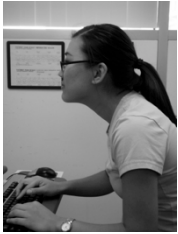

- Long-standing neck pain (>12 weeks)
- Symptoms are often linked to a precipitating trauma/whiplash and may be present for an extended period of time

© Original Author
Reproduction rights obtainable from
www.CartoonStock.com

I tell you what: If it weren't for the headrest, I would have serious whiplash right now...

▪ Ergonomic inefficiencies with performing repetitive activities

Key findings

- Strength, endurance, and coordination deficits of the deep neck flexor muscles
- Cranial cervical flexion test
- Deep neck flexor endurance test

Strength, endurance and coordination deficits:

- Middle trapezius
- Lower trapezius
- Serratus anterior

Flexibility deficits of upper quarter muscles

- Anterior/middle/posterior scalenes
- Upper trapezius
- Levator scapulae
- Pectoralis minor
- Pectoralis major

Sound familiar?

Janda (1987, 1988)

Upper Crossed Syndrome

a
©Human Kinetics 2010

Interventions

- Patient education and counseling
- Coordination, strengthening, and endurance exercise
- Stretching exercise

a

Neck Pain ICF Impairment-based Classification:

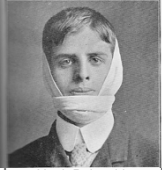

a
©Human Kinetics 2010

Is it fair to say:

- Faulty alignment
- Incoordinated movements
- Weakness of stabilizing muscles
- Over lengthened or short muscles

Contribute

Neck Pain with
Mobility Deficits

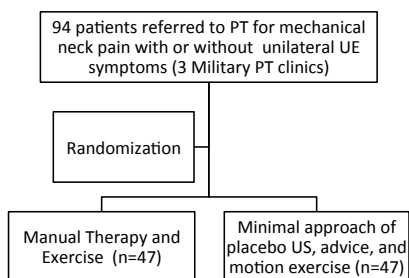

Neck Pain with
Movement
Coordination
Impairments

**Evidence for Manual Physical Therapy
Management of Cervical Spine Disorders**

- Neck pain with mobility deficits/Hypomobility
- Neck pain with movement coordination impairments/Instability
- Neck pain with headache/Cervicogenic Headache
- Neck pain with movement coordination impairments/Acute pain/Whiplash
- Neck pain with radiating arm pain/Radiculopathy

**Neck Pain with Mobility Deficits/
Hypomobility**

**The Effectiveness of Manual Physical Therapy and
Exercise for Mechanical Neck Pain**
A Randomized Clinical Trial

Walker MJ, Boyles RE, Young BA, et al. Spine. 33(22):2371-2378.

Manual Physical Therapy and Exercise

- Examination
 - Tests and measures: ROM, PIVM tests for mobility and pain provocation, upper quarter neuro screen, special tests for cervical impairments
- Evaluation
 - **"interventions specifically targeted to impairments identified during the Physical Examination"**
- Interventions
 - Thrust and non-thrust manipulation
 - Exercises to target specific impairments such as deep neck flexor strengthening
 - Both groups received 6 treatment sessions over a 3 week period (2x/week)

Neck Disability Index (0-50)

Visual Analog Scale (0-100) for Cervical Pain Scores

Conclusion from Walker et al.

- An “**impairment-based** Manual Physical Therapy approach” resulted in clinically and statistically significant short- and long-term improvements in pain, disability, and patient perceived recovery when compared to a program of advice, motion exercises, and sub therapeutic ultrasound

Impairment-based Approach

- ⊙ Assess spinal segmental and direction of hypomobility or hypermobility
- ⊙ Reproduce pain and address reactivity
- ⊙ Assess strength and neuromuscular control
- ⊙ Specific manipulation to address hypomobility impairments and pain
- ⊙ Specific exercise to address weakness, instability, and neuromuscular control
- ⊙ Integrate manipulation with Exercise

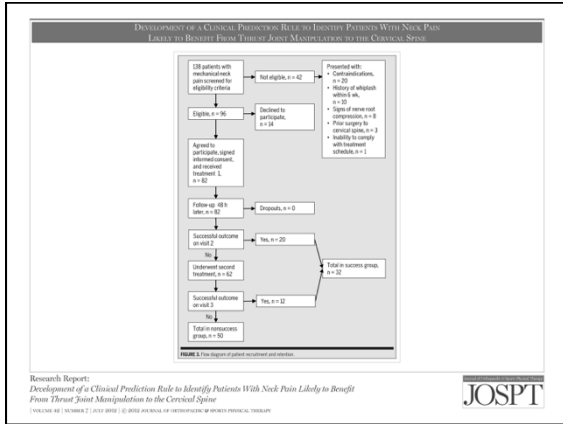

RESEARCH REPORT

Development of a Clinical Prediction Rule to Identify Patients With Neck Pain Likely to Benefit From Thrust Joint Manipulation to the Cervical Spine

J Orthop Sports Phys Ther 2012;42(7):577-592. Epub 14 May 2012. doi:10.2519/jospt.2012.4243

JOSPT
[VOLUME 42] NUMBER 7 [JULY 2012]

© 2012 JOURNAL OF ORTHOPAEDIC & SPORTS PHYSICAL THERAPY

CPR for benefit of thrust manipulation of cervical spine

- Symptom duration of less than 38 days
- Positive expectation that manipulation will help
- Side to side difference of cervical rotation of 10 degrees or more
- Pain with P/A testing mid cervical spine

Cervical Spine Uplide Manipulation

Cervical spine uplide manipulation

Factors impacting increased likelihood of adverse reactions

- History of neck trauma**
- Pain less than 1 year**
- Worsening of pain since onset**
- Pain ratings of 8+ on a 0-10 scale**
- NDI scores 16 or more**
- Moderate or severe headache**
- Nausea during the past month**
- Lack of confidence in the treatment**

Hurwitz J Manip Phys Ther 2004

Development of a Clinical Prediction Rule for Guiding Treatment of a Subgroup of Patients With Neck Pain: Use of Thoracic Spine Manipulation, Exercise, and Patient Education

Joshua A Cleland, John D Childs, Julie M Fritz, Julie M Whitman, Sarah L Eberhart
Volume 87 Number 1 Physical Therapy

Physical Therapy

January 2007

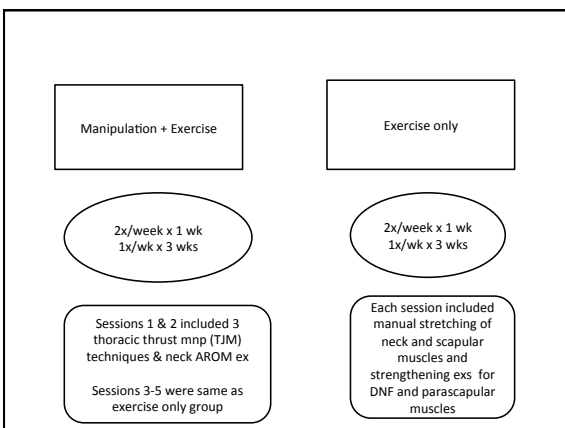

Research Report

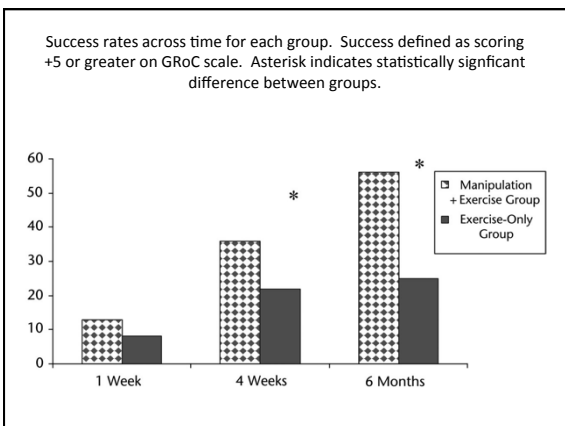

Examination of a Clinical Prediction Rule to Identify Patients with Neck Pain Likely to Benefit from Thoracic Spine Thrust Manipulation and a General Cervical ROM Exercise:
Multi-Center Randomized Clinical Trail

Cleland, Mintken, Carpenter, Fritz, Glynn, Whitman, and Childs.
Physical Therapy; 90(9):2010.

Conclusions

- The results of the current study did not support the validity of the previously developed CPR
- 2-way interaction between group and time suggests that **patients with mechanical neck pain** who do not exhibit any contraindications to manipulation exhibit statistically significant improvements in disability in both the short- and long-term follow-up periods with thoracic TJM

Masaracchio M, et al. Short-term combined effects of thoracic spine thrust manipulation and cervical spine nonthrust manipulation in individuals with mechanical neck pain: A randomized clinical trial. J Orthop Sports Phys Ther 2013;43(3):118-127.

At 1 week: Combination of thoracic spine thrust manipulation + cervical spine nonthrust manipulation had better improvements in pain, disability, and global ratings of change

Supine Mid-Thoracic Rotation Thrust Manipulation

Supine mid-thoracic rotation thrust

Impairment-Based Manual Physical Therapy Approach

- **Manipulate targeted Hypomobile Cervical and Thoracic Segments**
- Therapeutic Exercise
 - **ROM**
 - Motor re-training/strengthening/Neuromuscular control
- Postural and ergonomic education

Neck Pain with Movement Coordination Impairments/ Cervical Instability

Delphi Survey for **Symptoms** of Cervical Spine Instability

- Intolerance to prolonged static postures
- Fatigue and inability to hold head up
- Better with external support
- Frequent need for self-manipulation
- Feeling of instability, shaking, or lack of control
- Frequent episodes of acute attacks
- Sharp pain with sudden movements

Cook C et al. Identifiers suggestive of clinical cervical spine instability: a Delphi study of physical therapists. Phys Ther. 85(9):995-996,2005.

Delphi Survey for **Exam** findings of Cervical Spine Instability

- **Poor coordination/neuromuscular control including poor recruitment and dissociation of cervical segments with movement**
- **Abnormal joint play**
- **Motion that is not smooth throughout range of motion including segmental hinging, pivoting, and fulcruming**
- **Aberrant movement**

Cook C et al, Identifiers suggestive of clinical cervical spine instability: a Delphi study of physical therapists. Phys Ther. 85(9):955-966,2005.

Cranio-cervical Flexion test

- **Head nod in 5 incremental stages of increasing range and hold 10 seconds**
- **Inferior performance has been noted in patients with neck pain and whiplash**

Jull et al, Impairment of the cervical flexors: a comparison of whiplash and insidious onset neck pain patients. Manual Therapy 2004b;9:89-94.

Deep Neck Extensor Training

O'Leary et al. Arch Physical Med and Rehabil. 2011; 92: 929-34.
Schomacher et al. Manual Therapy 2012; 17(6):544-8

Impairment-Based Manual Physical Therapy Approach – Movement Coordination Impairments

- Manipulate targeted hypomobile segments **above and below region of instability**
- Therapeutic Exercise
 - Motor re-training/strengthening/Neuromuscular control
- Postural and ergonomic education

Neck pain with headache/
Cervicogenic Headache

Cervicogenic headache

- Unilateral headache with onset preceded by neck pain
- Headache pain triggered by neck movement or positions
- Headache pain elicited by pressure on posterior neck especially at one of the 3 upper cervical joints (Jull, 2002)

Flexion-Rotation Test

Hall et al (2010 JOSPT)

A Randomized Controlled Trial of Exercise and Manipulative Therapy for Cervicogenic Headache
Gwendolen Jull, PT, PhD,* Patricia Trott, PT, MSc,† Helen Potter, PT, et al.

SPINE Volume 27, Number 17, pp 1838-1843, 2002

Manual Therapy interventions

- 8-12 treatment sessions with a physical therapist over a 6 week treatment period
- PTs vary treatments based on examination and re-examinations of the patients in the treatment groups.

Manual Therapy

Therapeutic exercises

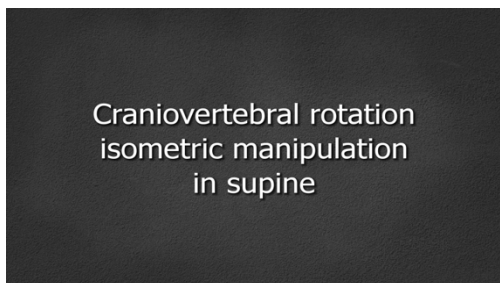

Results

- Beneficial effects were found for headache frequency and intensity and neck pain and disability for both manual therapy and exercise used alone and in combination at both 7 weeks and 12 months follow up.
- Ten percent more of the participants receiving the combined therapy obtained good and excellent results lending support for the combined use of specific therapeutic exercise and manual therapy to treat patients with cervicogenic headaches.

Conclusion

- Jull's study illustrates the effectiveness of an impairment based manual physical therapy approach that combines manual therapy and exercise for treatment of patients with cervicogenic headache.

Craniovertebral Rotation Isometric Manipulation

Craniovertebral Distraction with C2 Stabilization

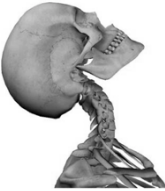

Impairment-Based Manual Physical Therapy Approach – Cervicogenic H/A

- Manipulate targeted hypomobile segments
 - **Target Craviovertebral mobility deficits**
- Therapeutic Exercise
 - **Motor re-training/strengthening/Neuromuscular control**
- **Postural and ergonomic education**

Whiplash Associated Disorders: Neck pain with movement coordination impairments/Acute pain/Whiplash

Elliott, may 2009 | volume 39 | number 5 | journal of orthopaedic & sports physical therapy

Prognostic Factors of poor outcomes from WAD

- Higher NDI(>30)
- High pain scores
- Older age
- Cold hyperalgesia
- Pressure Pain Threshold
- Post traumatic stress
- Kinesiophobia
- Greater decreased ROM
- Poor tolerance to Exam

– Sterling, Pain, 2005 and 2006
Sterling M. Physical and psychological factors maintain long-term predictive capacity post-whiplash injury. Pain 122:102-108, 2006

Sensory change Assessment

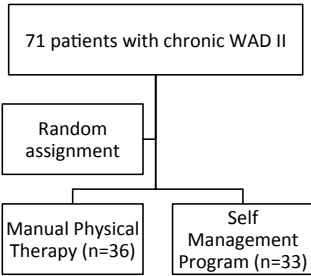

Cold Pain Threshold **Pressure Pain threshold**

Elliott, may 2009 | volume 39 | number 5 |

therapy

Does the presence of sensory hypersensitivity influence outcomes of physical rehabilitation for chronic whiplash?—A preliminary RCT

G Jull, PT, PhD, M. Sterling, J Kenardy, E. Beller

```
graph TD; A[71 patients with chronic WAD II] --> B[Random assignment]; B --> C[Manual Physical Therapy (n=36)]; B --> D[Self Management Program (n=33)];
```

Pain 129 (2007) 28-34

Manual Physical Therapy

Non-thrust manipulation- low load to avoid provocation of symptoms **DNF and scapular exercises**

Self Management Program

- Education Booklet
 - Assurance of recovery
 - Encouraged to stay active
- Ergonomic advice (similar to MPT)
- Home Exercise program 2x/day (similar to MPT)

Results

- ⊙MPT can reduce pain and disability in chronic WAD
- ⊙Change in DNF control improved with MPT
- ⊙72.5% had sensory changes at baseline
- ⊙Subgroup with both widespread mechanical and cold hyperalgesia had the least improvement

Impairment-Based Manual Physical Therapy Approach - Whiplash

- **Manipulate targeted hypomobile/Reactive segments – gentle nonthrust**
- Therapeutic Exercise
 - Motor re-training/ strengthening/ Neuromuscular control/non-provocative
- Postural and ergonomic education

Neck pain with Radiating Arm Pain/Cervical Radiculopathy

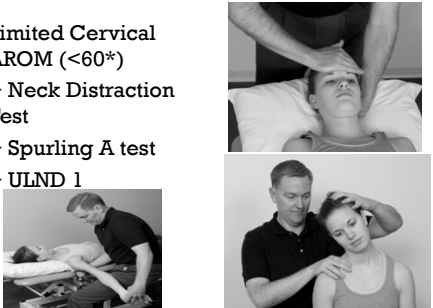

Mechanical traction for neck pain with or without radiculopathy
N Graham, A Gross, C Goldsmith, et al

- **Main results**
Of the seven selected RCTs (total participants = 958), only one (N = 100) had a low risk of bias. It found no statistically significant difference (SMD -0.16; 95% CI: -0.59 to 0.27) between continuous traction and placebo traction in reducing pain or improving
- **No evidence from RCTs with a low potential for bias that clearly supports or refutes the use of either continuous or intermittent traction for neck disorders.**

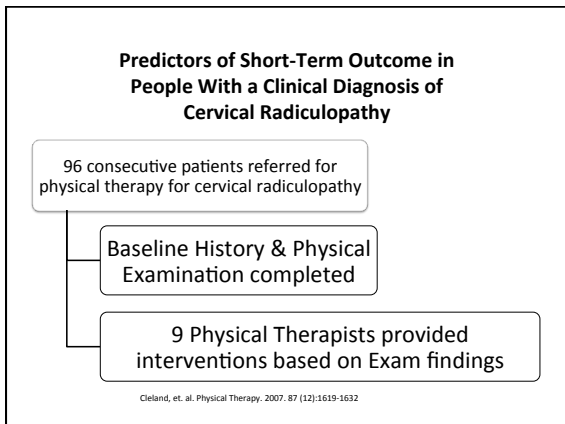

The Cochrane Collaboration and published in The Cochrane Library 2009

Signs of cervical radiculopathy

- Limited Cervical AROM (<60°)
- + Neck Distraction Test
- + Spurling A test
- + ULND 1

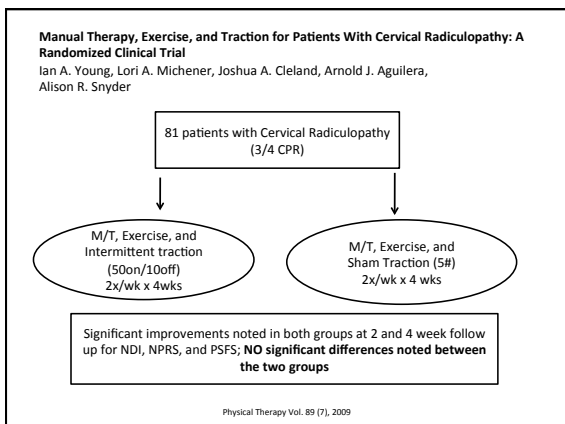

Wainner RS, Fritz JM, Irrgang JJ, et al; Spine 28(1):52-62, 2003

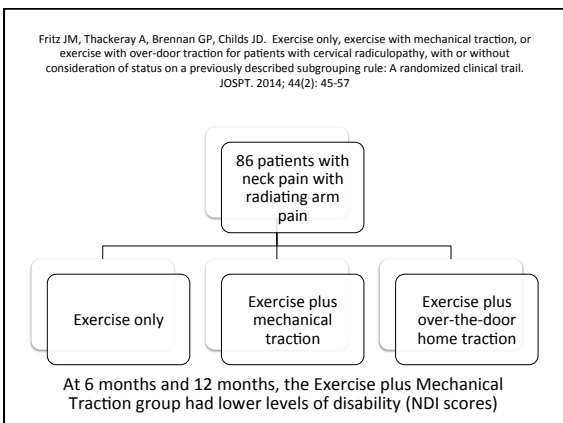

Results

| Variable | Post-test probability of success |
|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| ● Age (<54 y) | 62.9 |
| ● Dominant arm is <i>not affected</i> | 62.9 |
| ● Looking down does <i>not worsen symptoms</i> | 59.5 |
| ● Multimodal treatment including manual therapy, cervical traction, and deep neck flexor muscle strengthening for at least 50% of visits | 71.3 |

The probability of success was calculated as positive likelihood ratios and assumed a pretest probability of 53%.

Impairment-Based Manual Physical Therapy Approach - Radiculopathy

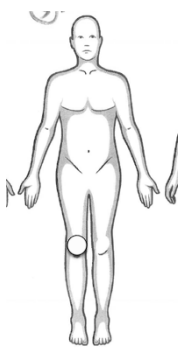

- **Manipulate targeted hypomobile segments - Cervical and Thoracic**
- Therapeutic Exercise
 - **Motor re-training/strengthening/Neuromuscular control**
- **Cervical Traction**
- **ULND glides**
- **Postural and ergonomic education**

Movement Systems Impairment

A stick figure is shown in a thinking pose, with a question mark above its head. A thought bubble next to it contains the text: "What is the underlying cause of musculoskeletal pain".

Anterior knee pain
What pathological diagnosis?
Patellofemoral pain

An anatomical drawing of a human figure from the waist down, showing the legs and feet. A circle is drawn around the knee joint on the right leg, indicating the area of interest.

Movement Systems Impairments

- Developed by Dr. Shirley Sahrmann
- Faulty movements and alignments contribute to musculoskeletal pain
- Diagnosis is made of the faulty alignment or movement

Movement system impairment
diagnosis?

**Femoral adduction internal
rotation**

Diagnosing the causative
movement impairment/posture....

**Leads to correction
of the impairment...**

Movement Systems Impairments

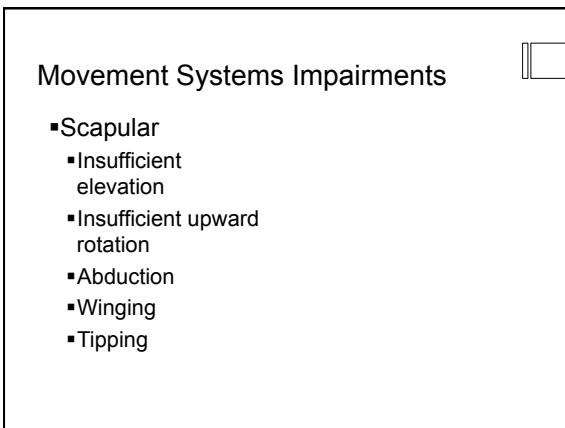

- Cervical Spine:
 - (Faulty) Extension*
 - (Faulty) Rotation*
 - (Faulty) Flexion

Faulty extension

Evidence based impairments related to neck pain

- Posture and alignment
- Impaired cervical musculature
- Scapular contribution to neck pain
- Shoulder elevation contribution to neck pain

Impaired posture and alignment

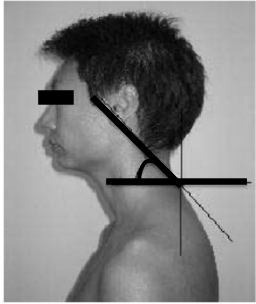

MANUAL THERAPY

The relationship between head posture and severity and disability of patients with neck pain

Chris Ho Ting Yip^a, Thomas Tai Wing Chiu^{b,*}, Anthony Tung Kuen Poon^c

Manual Therapy 13 (2008) 148–154

- 62 subjects with neck pain
- 52 controls without neck pain

"Neck pain patients tended to have greater upper thoracic flexion and head forward postures"

UPPER CROSSED SYNDROME

- Hanten et al. (1991)
 - Extended upper cervical spine and protracted shoulder girdles related to increased kyphosis
- Falla et al (2007) and Straker et al. (2008):
 - Flexion of the whole spine increased EMG activity in cervical erector spinae- increasing pressure on the posterior structures

Impaired cervical musculature

SHAUN O'LEARY, PT, PhD¹ • DEBORAH FALLA, PT, PhD²
JAMES M. ELLIOTT, PT, PhD³ • GWENDOLEN JULL, PT, PhD⁴

Muscle Dysfunction in Cervical Spine Pain: Implications for Assessment and Management

Neck pain can be a disabling and recurrent disorder characterized by periods of remission and exacerbation. It has been estimated that in any 12-month period 25% of adults experience neck pain, with approximately 10% having recurrent activity throughout the year. Interestingly, a cross-sectional study has suggested that only 6.7% of individuals who notified their neck pain to the physician were free of interference.¹

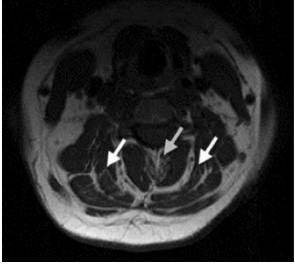

This indicates the chronicity of some neck pain and the need for additional care at times for additional or more appropriate management of chronic neck pain. The pathophysiology of chronic neck pain is poorly understood, but appears to represent a complex interplay between the anatomy of the cervical spine, and changes in the muscles that surround the spine. "Muscle dysfunction in the neck may be a significant factor in the pathophysiology of chronic neck pain, especially considering the high dependency of the cervical spine on the muscles that surround the spine." "Muscle dysfunction in the neck may be a significant factor in the pathophysiology of chronic neck pain, especially considering the high dependency of the cervical spine on the muscles that surround the spine."

J Orthop Sports Phys Ther 2009;39(5):324-333.

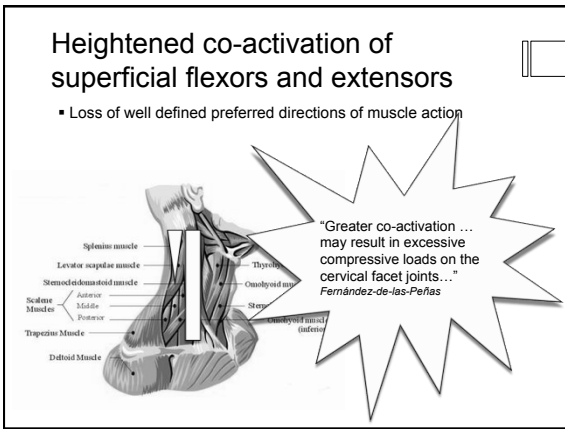

Changes in physical structure

Elliott (2006)

- Cross-sectional area
- Fatty infiltration
- Fiber type

Inability to relax- repetitive upper extremity movements

- Superficial cervical flexors
- Upper trapezius

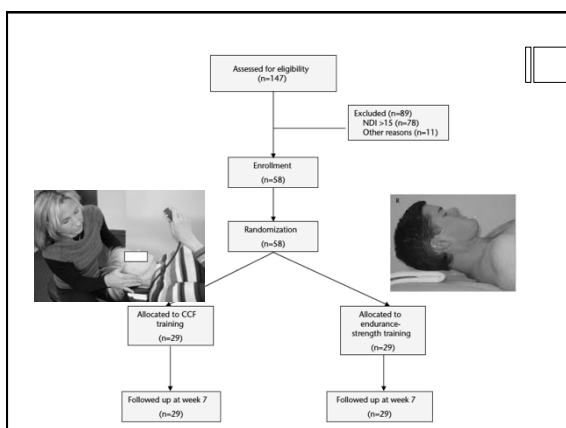

Effect of Neck Exercise on Sitting Posture in Patients With Chronic Neck Pain

Deborah Falla, Gwendolen Jull, Trevor Russell, Bill Vicenzino, Paul Hodges

Phys Ther. 2007;87:408–417

Questions:

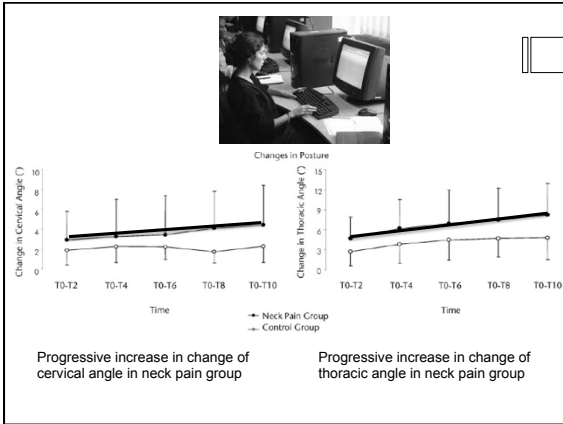

- Do people with neck pain demonstrate differences in ability to maintain upright posture when distracted
- Compare effects of low-load craniocervical flexion training vs. conventional neck flexor endurance-strength training

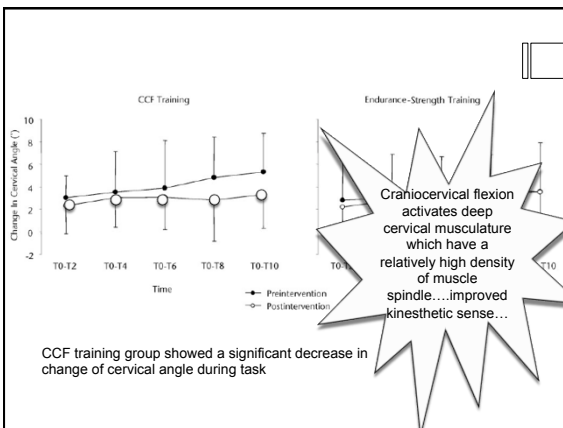

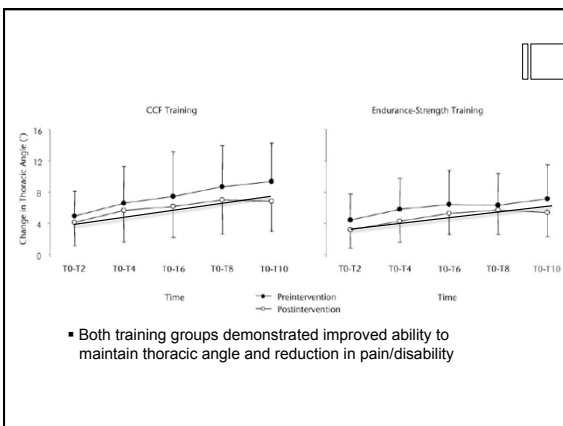

Methods

- Change in cervical and thoracic posture measured at 2 min intervals
- Total time: 10 minutes

Clinical integration:

- Observation: Posture and active movements
- Engage the deep neck flexors, correct head forward posture
- Reassess active movements and symptoms
- Correction of thoracic kyphosis with reassessment of symptomatic movement

Upper extremity use and it's connection to neck pain...

Prevalence and occupational associations of neck pain in the British population
 by Palmer KT, Walker-Bone K, Griffin MJ, Syddall H, Pannett B, Coggon D, Cooper C

Scand J Work Environ Health 2001;27(1):49-56
 doi:10.5271/sjweh.586

Survey of 22,000 working-aged adults

- Some evidence for occupational influence on neck disorders
- Excess of neck pain in male construction workers
- Disabling neck pain in female nurses

Table 4. Risk of neck pain by occupational activity. (PR - prevalence rate ratio, 95% CI - 95% confidence interval, +ve - positive for symptoms)

CERVICAL SEGMENTAL MOTION INDUCED BY SHOULDER ABDUCTION ASSESSED BY MAGNETIC RESONANCE IMAGING

Hiroshi Takasaki, PT, M.Sc.¹
Toby Hall, PT, M.Sc.²

Spine 2009;34:E122-E126

Figure 2. Alignment angle and Rotation angle

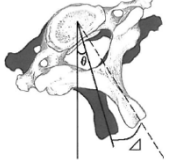

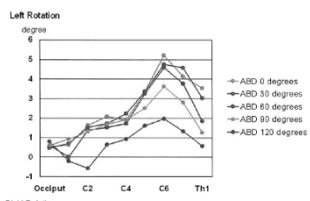

Figure 3.

- 22 pain free subjects
- Kinematic MRI at 0,30,60,90, 120 degrees of abduction

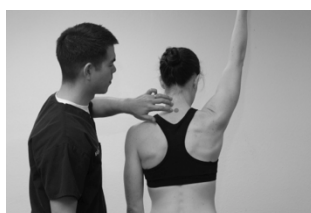

Figure 5: The rotation angles for each vertebra and each arm position. The vertical axis shows degree of rotation, positive values indicating left rotation. The horizontal axis shows each vertebra.

- Passive shoulder abduction has no effect
- Isometric shoulder abduction up to 90 degrees induces left rotation throughout spine
- Largest movement at C6

Cervical Rotation Movement Fault

U/L shoulder Flexion:
-- Lower Cervical rotation

The Immediate Effect of Passive Scapular Elevation on Symptoms With Active Neck Rotation in Patients With Neck Pain

Linda R. Van Dillen, PT, PhD,*† Mary Kate McDonnell, PT, DPT, OCS,*†
Thomas M. Susco, MEd, DPT, ATC,‡ and Shirley A. Sahrman, PT, PhD, FAPTA*

(*Clin J Pain* 2007;23:641–647)

Sample Size

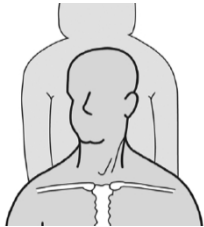

- 46 patients
- 30 women
- 16 men
- Long standing history of neck pain
- Moderate symptoms and disability

Methods

- Symptom report
- Range of motion
- A) Patient preferred posture
- B) Scapulae elevated posture

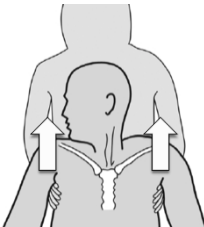

Patient preferred posture

- 29/46 (63%) reported increase in symptoms with neck rotation in patient preferred posture

Elevated scapulae

- A decrease in symptoms in right rotation (82%)
- A decrease in symptoms in left rotation (76%)

Conclusion

- Elevation of scapulae
 - Improved rotation
 - Reduced symptoms

Proposed mechanisms

- 1. Decreased load (and weight of arms) on cervicospinal muscles, removes **passive** stretch
- Removes **passive** limitation to rotation
- From short or stiff trapezius or levator scapulae

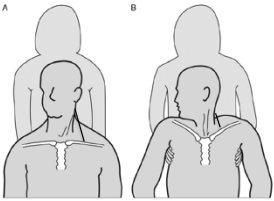

Diagram A shows a person's head and neck rotated to the right. Diagram B shows the same person with their arms supported by a desk, and their head and neck rotated to the right. The diagrams illustrate the change in neck muscle stretch when the arms are supported.

- 2. Elevation decreased active tension in levator scap and upper trapezius
- **Schuldt et al. (1987)** showed decreased EMG activity with elbows supported in work activities

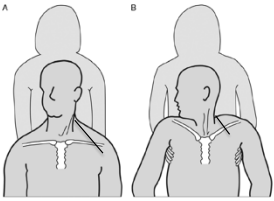

Diagram A shows a person's head and neck rotated to the right. Diagram B shows the same person with their arms supported by a desk, and their head and neck rotated to the right. The diagrams illustrate the change in neck muscle stretch when the arms are supported.

- 3. Elevation may decrease stretch on brachial plexus with head rotation

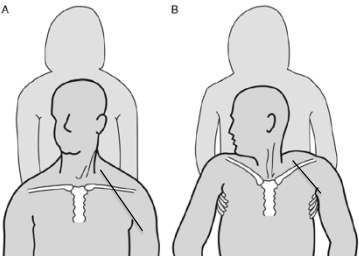

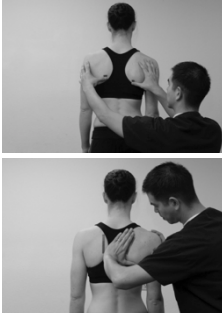

Diagram A shows a person's head and neck rotated to the right. Diagram B shows the same person with their arms supported by a desk, and their head and neck rotated to the right. The diagrams illustrate the change in neck muscle stretch when the arms are supported.

Clinical integration:

- Observation of shoulder girdle posture
- Observation of cervical movement with shoulder elevation
- Presence of radiating symptoms
- Presence of symptoms in the upper trapezius or levator scapulae
- Correction of impairments with reassessment of functional movement

- Assess effects of shoulder unloading on active movement and symptoms

Lab Case 1:

Integrated examination:

- Posture/correction
- Determine contribution of faults to pain syndrome
- Active cervical ROM and correction
- Deep neck flexor engagement in functional motion
- Deep neck flexor endurance or craniocervical flexion test
- Scapular unloading
- PAIVM and PPIVM examination of cervical spine

Craniovertebral Rotation Isometric Manipulation in supine

Craniovertebral Distraction with C2 Stabilization

Lab Case 2:
